Unstable Modes in Magnetic Nozzle

Hunt Feng

September 7, 2022

1 Equations of Motion

1.1 Linearized Equations of Motion

The dynamics of magnetic nozzle can be characterized by conservation of mass and momentum,

$$\begin{split} \frac{\partial n}{\partial t} + B \frac{\partial}{\partial z} \left(\frac{nv}{B} \right) &= 0 \\ \frac{\partial v}{\partial t} + v \frac{\partial v}{\partial z} &= -c_s^2 \frac{1}{n} \frac{\partial n}{\partial z} \end{split}$$

Usually, the magnetic field can be described by

$$B(z) = B_0 \left[1 + R \exp\left(-\frac{z^2}{\delta^2}\right) \right]$$

where R and δ are some coefficients.

At equilibrium (stationary solution), we have $\partial n_0/\partial t = 0$ and $\partial v_0/\partial t = 0$, so n_0 and v_0 satisfy

$$\frac{\partial}{\partial z} \left(\frac{n_0 v_0}{B} \right) = 0$$

$$v_0 \frac{\partial v_0}{\partial z} = -c_s^2 \frac{1}{n_0} \frac{\partial n_0}{\partial z}$$

Let $M \equiv v_0/c_s$, then it can be represented by Lambert function,

$$M = \left[-W \left(-M_m^2 \frac{B(z)^2}{B_m^2} e^{-M_m^2} \right) \right]^{1/2}$$

where $B_m \equiv 1 + R$ is the maximum magnetic field (or magnetic field at mid-point), and M_m is the mach number at mid-point. Below shows a few cases of the solution.

- $M_m < 1$, subsonic velocity profile.
- $M_m = 1$, accelerating or decelerating profile (depending on the branch of the Lambert function).
- $M_m > 1$, supersonic velocity profile

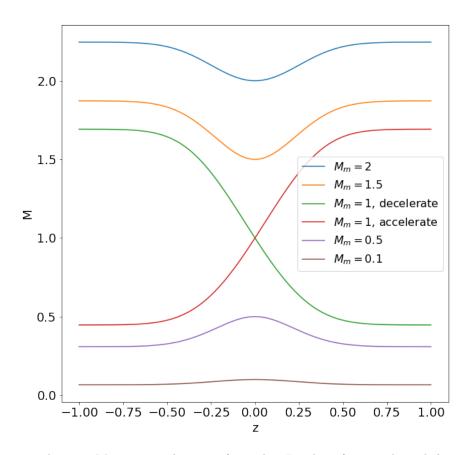

Figure 1: $M_m < 1$, subsonic. $M_m = 1$, accelerating if we select Lambert function branch k = 0 for z < 0 and brach k = -1 for z > 0; decelerating if we choose branch k = -1 for z < 0 and brach k = 0 for z > 0. $M_m > 1$, supersonic.

For convenience, we nondimensionalize the equations by normalizing the velocity to c_s , $v \mapsto v/c_s$, z to system length L, $z \mapsto z/L$ and time $t \mapsto c_s t/L$.

$$\frac{\partial n}{\partial t} + n \frac{\partial v}{\partial z} + v \frac{\partial n}{\partial z} - nv \frac{\partial_z B}{B} = 0 \tag{1}$$

$$n\frac{\partial v}{\partial t} + nv\frac{\partial v}{\partial z} = -\frac{\partial n}{\partial z} \tag{2}$$

and the nondimensionalized equilibrium condition is

$$\frac{\partial}{\partial z} \left(\frac{n_0 v_0}{B} \right) = 0 \tag{3}$$

$$v_0 \frac{\partial v_0}{\partial z} = -\frac{1}{n_0} \frac{\partial n_0}{\partial z} \tag{4}$$

Proposition 1. Let $n = n_0(z) + \tilde{n}(z,t)$ and $v = v_0(z) + \tilde{v}(z,t)$, the linearized equations of motion are

$$\frac{1}{n_0} \frac{\partial \tilde{n}}{\partial t} + \frac{\partial \tilde{v}}{\partial z} + v_0 \tilde{Y} + \tilde{v} \frac{\partial_z n_0}{n_0} - \tilde{v} \frac{\partial_z B}{B} = 0$$
 (5)

$$\frac{\partial \tilde{v}}{\partial t} + \frac{\partial (v_0 \tilde{v})}{\partial z} = -\tilde{Y} \tag{6}$$

where

$$\tilde{Y} \equiv \frac{1}{n_0} \frac{\partial \tilde{n}}{\partial z} - \frac{\partial_z n_0}{n_0^2} \tilde{n} = \frac{\partial}{\partial z} \left(\frac{\tilde{n}}{n_0} \right)$$

Proof. We first derive Eq.(5). We linearize Eq.(3) by setting $n = n_0 + \tilde{n}$ and $v = v_0 + \tilde{v}$. By ignoring the second order perturbations, we obtain

$$\begin{split} &\frac{\partial (n_0 + \tilde{n})}{\partial t} + (n_0 + \tilde{n}) \frac{\partial (v_0 + \tilde{v})}{\partial z} + (v_0 + \tilde{v}) \frac{\partial (n_0 + \tilde{n})}{\partial z} - (n_0 + \tilde{n})(v_0 + \tilde{v}) \frac{\partial_z B}{B} = 0 \\ &\Rightarrow \frac{\partial \tilde{n}}{\partial t} + n_0 \frac{\partial v_0}{\partial z} + \tilde{n} \frac{\partial v_0}{\partial z} + n_0 \frac{\partial \tilde{v}}{\partial z} + v_0 \frac{\partial n_0}{\partial z} + \tilde{v} \frac{\partial n_0}{\partial z} + v_0 \frac{\partial \tilde{n}}{\partial z} - (n_0 v_0 + n_0 \tilde{v} + \tilde{n} v_0) \frac{\partial_z B}{B} = 0 \\ &\Rightarrow \frac{1}{n_0} \frac{\partial \tilde{n}}{\partial t} + \frac{\partial v_0}{\partial z} + \frac{\tilde{n}}{n_0} \frac{\partial v_0}{\partial z} + \frac{\partial \tilde{v}}{\partial z} + \frac{v_0}{n_0} \frac{\partial n_0}{\partial z} + \frac{\tilde{v}}{n_0} \frac{\partial n_0}{\partial z} + \frac{v_0}{n_0} \frac{\partial \tilde{n}}{\partial z} - v_0 \frac{\partial_z B}{B} - \tilde{v} \frac{\partial_z B}{B} - \tilde{n} \frac{v_0}{n_0} \frac{\partial_z B}{B} = 0 \end{split}$$

Using the equilibrium condition Eq.(3), some of the terms are canceled and the last term can be written as

$$\tilde{n}\frac{v_0}{n_0}\frac{\partial_z B}{B} = \frac{\tilde{n}}{n_0} \left(\frac{\partial_z n_0}{n_0} v_0 + \frac{\partial v_0}{\partial z} \right)$$

Now, we are left with equation

$$\frac{1}{n_0} \frac{\partial \tilde{n}}{\partial t} + \frac{\partial \tilde{v}}{\partial z} + v_0 \underbrace{\left(\frac{1}{n_0} \frac{\partial \tilde{n}}{\partial z} - \frac{\tilde{n}}{n_0} \frac{\partial_z n_0}{n_0}\right)}_{\tilde{v}} + \frac{\tilde{v}}{n_0} \frac{\partial n_0}{\partial z} - \tilde{v} \frac{\partial_z B}{B} = 0$$

To derive Eq.(6), we linearize the LHS of the conservation of momentum

$$(n_{0} + \tilde{n})\frac{\partial(v_{0} + \tilde{v})}{\partial t} + (n_{0} + \tilde{n})(v_{0} + \tilde{v})\frac{\partial(v_{0} + \tilde{v})}{\partial z} = -\frac{\partial n}{\partial z}$$

$$\Rightarrow \frac{\partial v_{0}}{\partial t} + \frac{\tilde{n}}{n_{0}}\frac{\partial v_{0}}{\partial t} + \frac{\partial \tilde{v}}{\partial t} + \left(v_{0} + \tilde{v} + \frac{\tilde{n}}{n_{0}}v_{0}\right)\frac{\partial(v_{0} + \tilde{v})}{\partial z} = -\frac{1}{n_{0}}\frac{\partial n}{\partial z}$$

$$\Rightarrow \frac{\partial v_{0}}{\partial t} + v_{0}\frac{\partial v_{0}}{\partial z} + \tilde{v}\frac{\partial v_{0}}{\partial z} = -\frac{1}{n_{0}}\frac{\partial n_{0}}{\partial z} - \frac{1}{n_{0}}\frac{\partial \tilde{n}}{\partial z} - v_{0}\frac{v_{0}}{z} - \frac{\tilde{n}}{n_{0}}v_{0}\frac{\partial v_{0}}{\partial z}$$

Using the equilibrium condition Eq.(4) on the RHS, we get the desired form.

2 Formulation of the problem

2.1 Polynomial Eigenvalue Problem

Proposition 2.

$$\frac{\partial}{\partial z} \ln \left(\frac{n_0}{B} \right) = -\frac{1}{v_0} \frac{\partial v_0}{\partial z} \tag{7}$$

Proof.

$$\frac{\partial}{\partial z} \ln \left(\frac{n_0}{B} \right) = \frac{B}{n_0} \frac{\partial}{\partial z} \left(\frac{n_0}{B} \right) = \frac{1}{n_0} \frac{n_0}{z} + B \frac{\partial}{\partial z} \left(\frac{1}{B} \right) = \frac{1}{n_0} \frac{n_0}{z} \underbrace{-\frac{1}{n_0 v_0}}_{E_{\mathcal{A}}(3)} \underbrace{\frac{\partial n_0 v_0}{\partial z}}_{E_{\mathcal{A}}(3)} = -\frac{1}{v_0} \frac{\partial v_0}{\partial z}$$

Proposition 3. Let $\tilde{n} \sim \exp(-i\omega t)$ and $\tilde{v} \sim \exp(-i\omega t)$, then we have the polynomial eigenvalue problem

$$-\Omega^{2}\tilde{v} + 2\Omega\left(v_{0}\frac{\partial}{\partial z} + \frac{\partial v_{0}}{\partial z}\right)\tilde{v} + \left[\left(1 - v_{0}^{2}\right)\frac{\partial^{2}}{\partial z^{2}} - \left(3v_{0} + \frac{1}{v_{0}}\right)\frac{\partial v_{0}}{\partial z}\frac{\partial}{\partial z} - \left(1 - \frac{1}{v_{0}^{2}}\right)\left(\frac{\partial v_{0}}{\partial z}\right)^{2} - \left(v_{0} + \frac{1}{v_{0}}\right)\frac{\partial^{2} v_{0}}{\partial z^{2}}\right]\tilde{v} = 0$$
(8)

where $\Omega \equiv i\omega$.

3

Proof.

$$\frac{1}{n_0} \frac{\partial \tilde{n}}{\partial t} + \frac{\partial \tilde{v}}{\partial z} + v_0 \tilde{Y} + \tilde{v} \frac{\partial_z n_0}{n_0} - \tilde{v} \frac{\partial_z B}{B} = 0$$
$$\frac{\partial \tilde{v}}{\partial t} + \frac{\partial (v_0 \tilde{v})}{\partial z} = -\tilde{Y}$$

We plug Eq.(6) in to Eq.(5), we have

$$-i\omega\frac{\tilde{n}}{n_0} + \frac{\partial \tilde{v}}{\partial z} - v_0 \left(-i\omega\tilde{v} + \frac{\partial (v_0\tilde{v})}{\partial z} \right) + \tilde{v}\frac{\partial_z n_0}{n_0} - \tilde{v}\frac{\partial_z B}{B} = 0$$

Using the equilibrium condition Eq.(3), we can eliminate the term $\partial_z B/B$,

$$-i\omega\frac{\tilde{n}}{n_0} + \frac{\partial \tilde{v}}{\partial z} + v_0 \left(i\omega\tilde{v} - v_0\frac{\partial \tilde{v}}{\partial z} - \tilde{v}\frac{\partial v_0}{\partial z}\right) - \tilde{v}\frac{\partial_z v_0}{v_0} = 0$$

$$\Rightarrow -i\omega\frac{\tilde{n}}{n_0} + i\omega v_0\tilde{v} + (1 - v_0^2)\frac{\partial \tilde{v}}{\partial z} - \left(v_0 + \frac{1}{v_0}\right)\frac{\partial v_0}{\partial z}\tilde{v} = 0$$

Now we take $\partial/\partial t$ on Eq.(6). Recall the fact that $\tilde{Y} = \partial(\tilde{n}/n_0)/\partial z$, we have

$$\omega^{2}\tilde{v} + i\omega \left(v_{0}\frac{\partial \tilde{v}}{\partial z} + \tilde{v}\frac{\partial v_{0}}{\partial z}\right) = \frac{\partial}{\partial t}\frac{\partial}{\partial z}\left(\frac{\tilde{n}}{n_{0}}\right)$$

$$\Rightarrow \omega^{2}\tilde{v} + i\omega \left(v_{0}\frac{\partial \tilde{v}}{\partial z} + \tilde{v}\frac{\partial v_{0}}{\partial z}\right) = \frac{\partial}{\partial z}\left(-i\omega v_{0}\tilde{v} - (1 - v_{0}^{2})\frac{\partial \tilde{v}}{\partial z} + \left(v_{0} + \frac{1}{v_{0}}\right)\frac{\partial v_{0}}{\partial z}\tilde{v}\right)$$

Expand the RHS and collect terms, we get

$$\begin{split} &\omega^2 \tilde{v} \\ &+ 2i\omega \left(v_0 \frac{\partial}{\partial z} + \frac{\partial v_0}{\partial z} \right) \tilde{v} \\ &+ \left[(1 - v_0^2) \frac{\partial^2}{\partial z^2} - \left(3v_0 + \frac{1}{v_0} \right) \frac{\partial v_0}{\partial z} \frac{\partial}{\partial z} - \left(1 - \frac{1}{v_0^2} \right) \left(\frac{\partial v_0}{\partial z} \right)^2 - \left(v_0 + \frac{1}{v_0} \right) \frac{\partial^2 v_0}{\partial z^2} \right] \tilde{v} = 0 \end{split}$$

Let $\Omega \equiv i\omega$, we obtain Eq.(8).

2.2 Eigenvalue problem

We can decouple the polynomial eigenvalue problem so that it becomes an eigenvalue problem. Let $a = \Omega \tilde{v}$, then Eq.(8) becomes

$$\begin{bmatrix} O & I \\ A_{21} & A_{22} \end{bmatrix} \begin{bmatrix} \tilde{v} \\ a \end{bmatrix} = \Omega \begin{bmatrix} \tilde{v} \\ a \end{bmatrix} \tag{9}$$

where O is zero matrix, I is identity matrix, and

$$A_{21} = (1 - v_0^2) \frac{\partial^2}{\partial z^2} - \left(3v_0 + \frac{1}{v_0}\right) \frac{\partial v_0}{\partial z} \frac{\partial}{\partial z} - \left(1 - \frac{1}{v_0^2}\right) \left(\frac{\partial v_0}{\partial z}\right)^2 - \left(v_0 + \frac{1}{v_0}\right) \frac{\partial^2 v_0}{\partial z^2}$$

$$A_{22} = 2\left(v_0 \frac{\partial}{\partial z} + \frac{\partial v_0}{\partial z}\right)$$

2.3 Variational Form

Definition 1. P and Q functions defined below can be used as an indicator of instabilities.

• P-function:

$$P \equiv -\frac{\partial v_0}{\partial z} \left(3v_0 + \frac{1}{v_0} \right) \tag{10}$$

• Q-function:

$$Q \equiv -\left(1 - \frac{1}{v_0^2}\right) \left(\frac{\partial v_0}{\partial z}\right)^2 - \left(v_0 + \frac{1}{v_0}\right) \frac{\partial^2 v_0}{\partial z^2}$$
(11)

Proposition 4.

$$\left(\omega_r^2 - \gamma^2\right) \left\langle \left|\tilde{v}\right|^2 \right\rangle - 2\omega_r \left\langle v_0 \operatorname{Im}\left(\tilde{v}^* \frac{\partial \tilde{v}}{\partial z}\right) \right\rangle - \gamma \left\langle \frac{\partial v_0}{\partial z} \left|\tilde{v}\right|^2 \right\rangle - \left\langle (1 - v_0^2) \left| \frac{\partial \tilde{v}}{\partial z} \right|^2 \right\rangle + \left\langle \left(Q - \frac{1}{2} \frac{\partial P}{\partial z}\right) \left|\tilde{v}\right|^2 \right\rangle = 0 \quad (12)$$

This is the full instability condition, we can determine whether the motion is stable or not by examining the number of solutions γ . If there are two real solutions (two real γ), then it's unstable, otherwise it is stable.

Proof. Starting from Eq.(8), we multiply \tilde{v}^* and take the average over the region, we have

$$\omega^{2}\left\langle \left|\tilde{v}\right|^{2}\right\rangle +2i\omega\left(\left\langle v_{0}\tilde{v}^{*}\frac{\partial\tilde{v}}{\partial z}\right\rangle +\left\langle \frac{\partial v_{0}}{\partial z}\left|\tilde{v}\right|^{2}\right\rangle \right) +\left[\left\langle (1-v_{0}^{2})\tilde{v}^{*}\frac{\partial^{2}\tilde{v}}{\partial z^{2}}\right\rangle +\left\langle P\tilde{v}^{*}\frac{\partial\tilde{v}}{\partial z}\right\rangle +\left\langle Q\left|\tilde{v}\right|^{2}\right\rangle \right] =0$$

Let $\omega \equiv \omega_r + i\gamma$, then

$$\left(\omega_{r}^{2}-\gamma^{2}+2i\omega_{r}\gamma\right)\left\langle \left|\tilde{v}\right|^{2}\right\rangle +2\left(i\omega_{r}-\gamma\right)\left(\left\langle v_{0}\tilde{v}^{*}\frac{\partial\tilde{v}}{\partial z}\right\rangle +\left\langle \frac{\partial v_{0}}{\partial z}\left|\tilde{v}\right|^{2}\right\rangle \right)+\left\langle \left(1-v_{0}^{2}\right)\tilde{v}^{*}\frac{\partial^{2}\tilde{v}}{\partial z^{2}}\right\rangle +\left\langle P\tilde{v}^{*}\frac{\partial\tilde{v}}{\partial z}\right\rangle +\left\langle Q\left|\tilde{v}\right|^{2}\right\rangle =0$$

We split the equation into real and imaginary part.

• Real:

There are two useful simplifications to keep in mind,

$$\operatorname{Re}\left(\tilde{v}^* \frac{\partial \tilde{v}}{\partial z}\right) = \frac{1}{2} \left(\tilde{v}^* \frac{\partial \tilde{v}}{\partial z} + \tilde{v} \frac{\partial \tilde{v}^*}{\partial z}\right) = \frac{1}{2} \frac{\partial |\tilde{v}|^2}{\partial z}$$

$$\left\langle \operatorname{Re}\left(\tilde{v}^* \frac{\partial^2 \tilde{v}}{\partial z^2}\right) \right\rangle = \left\langle \frac{1}{2} \left(\tilde{v}^* \frac{\partial^2 \tilde{v}}{\partial z^2} + \tilde{v} \frac{\partial^2 \tilde{v}^*}{\partial z^2}\right) \right\rangle = \left\langle \frac{1}{2} \left(\frac{\partial}{\partial z} \left(\tilde{v}^* \frac{\partial \tilde{v}}{\partial z}\right) + \frac{\partial}{\partial z} \left(\tilde{v} \frac{\partial \tilde{v}^*}{\partial z}\right) - 2 \left|\frac{\partial \tilde{v}}{\partial z}\right|^2\right) \right\rangle = \left\langle \left|\frac{\partial \tilde{v}}{\partial z}\right|^2\right\rangle$$

The second formula uses the fact $\tilde{v} = 0$ on boundaries (Dirichlet condition), so $\langle \partial \text{product of } \tilde{v}/\partial z \rangle = 0$. Now we separate the real part,

$$\begin{split} \left(\omega_{r}^{2}-\gamma^{2}\right)\left\langle \left|\tilde{v}\right|^{2}\right\rangle -2\omega_{r}\left\langle v_{0}\operatorname{Im}\left(\tilde{v}^{*}\frac{\partial\tilde{v}}{\partial z}\right)\right\rangle -\gamma\left\langle v_{0}\frac{\partial\left|\tilde{v}\right|^{2}}{\partial z}\right\rangle -2\gamma\left\langle \frac{\partial v_{0}}{\partial z}\left|\tilde{v}\right|^{2}\right\rangle \\ -\left\langle \left(1-v_{0}^{2}\right)\left|\frac{\partial\tilde{v}}{\partial z}\right|\right\rangle +\left\langle \frac{1}{2}P\frac{\partial\left|\tilde{v}\right|^{2}}{\partial z}\right\rangle +\left\langle Q\left|\tilde{v}\right|^{2}\right\rangle =0 \end{split}$$

The term with γ can combine by swithing the position of $\partial/\partial z$,

$$-\gamma \left\langle v_0 \frac{\partial |\tilde{v}|^2}{\partial z} \right\rangle - 2\gamma \left\langle \frac{\partial v_0}{\partial z} |\tilde{v}|^2 \right\rangle = -\gamma \left\langle \frac{\partial v_0}{\partial z} |\tilde{v}|^2 \right\rangle$$

The P and Q term can combine as well

$$\left\langle \frac{1}{2}P\frac{\partial \left|\tilde{v}\right|^{2}}{\partial z}\right\rangle + \left\langle Q\left|\tilde{v}\right|^{2}\right\rangle = \left\langle \left(Q - \frac{1}{2}\frac{\partial P}{\partial z}\right)\left|\tilde{v}\right|^{2}\right\rangle$$

The desired instability condition follows.

• Imaginary:

Although the imaginary part is not important, we derive it too.

This time, we notice that

$$\left\langle \operatorname{Im} \left(\tilde{v}^* \frac{\partial^2 \tilde{v}}{\partial z^2} \right) \right\rangle = \left\langle \frac{1}{2} \left(\tilde{v}^* \frac{\partial^2 \tilde{v}}{\partial z^2} - \tilde{v} \frac{\partial^2 \tilde{v}^*}{\partial z^2} \right) \right\rangle = \left\langle \frac{1}{2} \left(\frac{\partial}{\partial z} \left(\tilde{v}^* \frac{\partial \tilde{v}}{\partial z} \right) - \frac{\partial}{\partial z} \left(\tilde{v} \frac{\partial \tilde{v}^*}{\partial z} \right) \right) \right\rangle = 0$$

$$2\omega_{r}\gamma\left\langle \left|\tilde{v}\right|^{2}\right\rangle + \omega_{r}\left\langle v_{0}\frac{\partial\left|\tilde{v}\right|^{2}}{\partial z}\right\rangle + 2\omega_{r}\left\langle \frac{\partial v_{0}}{\partial z}\left|\tilde{v}\right|^{2}\right\rangle - 2\gamma\left\langle v_{0}\operatorname{Im}\left(\tilde{v}^{*}\frac{\partial\tilde{v}}{\partial z}\right)\right\rangle + \left\langle P\operatorname{Im}\left(\tilde{v}^{*}\frac{\partial\tilde{v}}{\partial z}\right)\right\rangle = 0$$

Proposition 5. For oscillations where $\omega_r \to 0$, the instability condition becomes

$$-\gamma^{2}\left\langle \left|\tilde{v}\right|^{2}\right\rangle + \gamma\left\langle \frac{\partial v_{0}}{\partial z}\left|\tilde{v}\right|^{2}\right\rangle - \left\langle (1-v_{0}^{2})\left|\frac{\partial \tilde{v}}{\partial z}\right|^{2}\right\rangle + \left\langle \left(Q - \frac{1}{2}\frac{\partial P}{\partial z}\right)\left|\tilde{v}\right|^{2}\right\rangle = 0$$

Therefore, unstable modes occur if

$$\left\langle \frac{\partial v_0}{\partial z} \left| \tilde{v} \right|^2 \right\rangle^2 + 4 \left\langle \left| \tilde{v} \right|^2 \right\rangle \left(- \left\langle (1 - v_0^2) \left| \frac{\partial \tilde{v}}{\partial z} \right|^2 \right\rangle + \left\langle \left(Q - \frac{1}{2} \frac{\partial P}{\partial z} \right) \left| \tilde{v} \right|^2 \right\rangle \right) > 0$$

3 Numerical Experiments

3.1 Constant velocity profile

If we set v_0 to Constant, then the eigenvalue

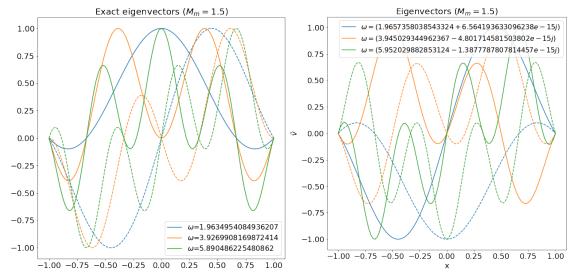

$$-\Omega^2 \tilde{v} + 2\Omega v_0 \frac{\partial}{\partial z} \tilde{v} + (1 - v_0^2) \frac{\partial^2}{\partial z^2} \tilde{v} = 0$$
(13)

where $\Omega \equiv i\omega$.

Then we have non-zero analytical solution

$$\tilde{v} = \exp\left(-\frac{\Omega}{v_0 + 1}\right) \left[\exp\left(\Omega \frac{z + 1}{v_0 + 1}\right) - \exp\left(\Omega \frac{z + 1}{v_0 - 1}\right)\right] \text{ where } \Omega = \frac{in\pi(1 - v_0^2)}{2}$$
(14)

Therefore, $\omega = -i\Omega = n\pi(1-v_0^2)/2$ are real. All modes are stable.

(a) First few exact eigenfunctions (ground mode not(b) First few numerical eigenfunctions by solving included). Eq.(9).

Figure 2: We see that the numerical eigenfunctions match the theoretical results. The numerical results are obtained by solving Eq.(9). Same conclusion can be drawn by solving Eq.(8).

3.1.1 "Unstable modes" for $v_0 > 1$

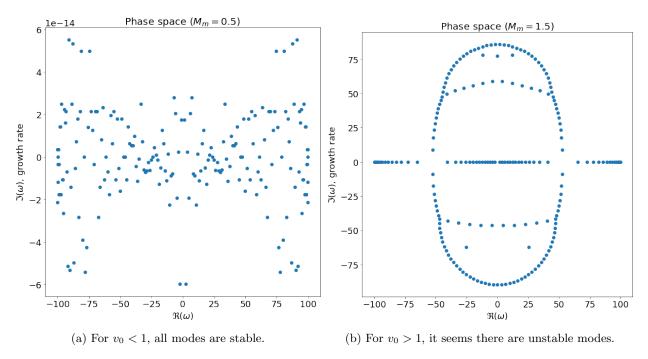

Figure 3: It seems there are unstable modes for $v_0 > 1$.

If we plot the eigenfunctions for the "unstable modes", we see that

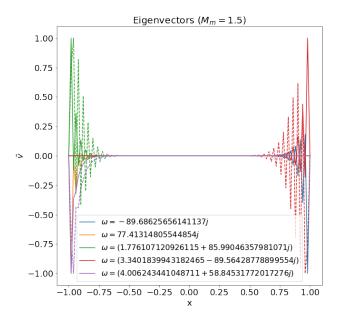

Figure 4: The eigenfunctions do not look right. For both equally-spaced finite difference differentiation matrix and Chebyshev differentiation matrix, these eigenfunctions will occur.

3.2 Subsonic case

The stability condition Eq.(12 is a quadratic equation about γ . Let

$$a = -\left\langle \left| \tilde{v} \right|^{2} \right\rangle$$

$$b = -\left\langle \frac{\partial v_{0}}{\partial z} \left| \tilde{v} \right|^{2} \right\rangle$$

$$c = \omega_{r}^{2} \left\langle \left| \tilde{v} \right|^{2} \right\rangle - 2\omega_{r} \left\langle v_{0} \operatorname{Im} \left(\tilde{v}^{*} \frac{\partial \tilde{v}}{\partial z} \right) \right\rangle - \left\langle \left(1 - v_{0}^{2} \right) \left| \frac{\partial \tilde{v}}{\partial z} \right|^{2} \right\rangle + \left\langle \left(Q - \frac{1}{2} \frac{\partial P}{\partial z} \right) \left| \tilde{v} \right|^{2} \right\rangle = 0$$

then the full instability condition becomes

$$D \equiv b^2 - 4ac$$

If the discriminant D > 0, it is unstable. If D < 0, it is stable. Subsonic modes are stable. The stability condition D < 0. Moreover, the eigenvalues are real.

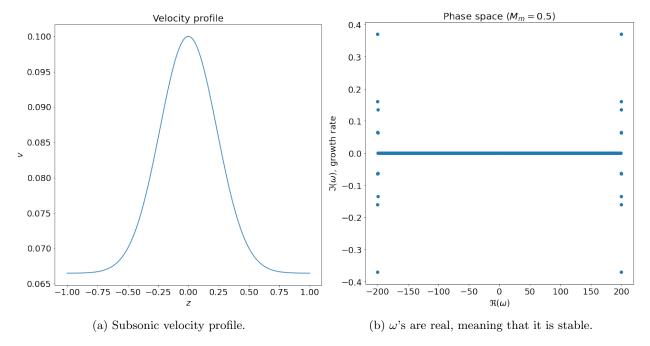

Figure 5: Solution to the polynomial eigenvalue problem Eq.(8) with subsonic velocity profile. ω 's are pure imaginary numbers, meaning that subsonic mode should be stable for most cases.

3.3 Accelerating case

Accelerating modes are unstable.

The stability condition for ground state is D = 0.00062 > 0.

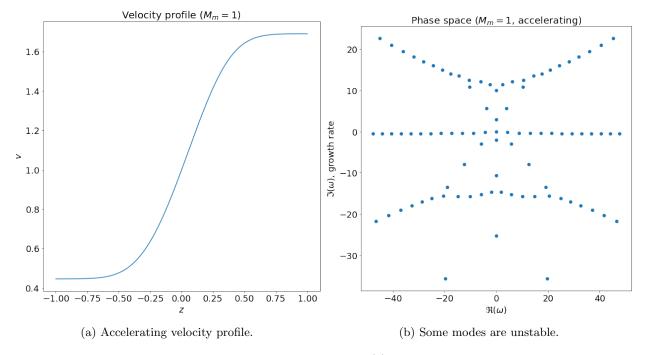

Figure 6: Solution to the polynomial eigenvalue problem Eq.(8) with accelerating velocity profile. ω 's are not on the real line, meaning that accelerating mode should be unstable for most cases.

3.4 Decelerating case

Decelerating modes are unstable.

The stability condition for ground state is D = 0.00062 > 0.

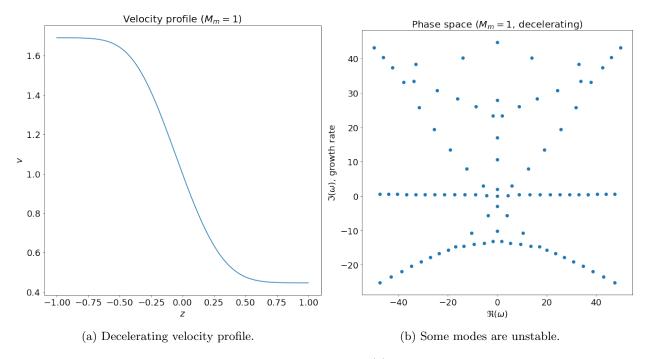

Figure 7: Solution to the polynomial eigenvalue problem Eq.(8) with decelerating velocity profile. ω 's are not on the real line, meaning that decelerating mode should be unstable for most cases.

3.5 Supersonic case

Supersonic modes are unstable.

The stability condition for ground state is D = 1.21025 > 0.

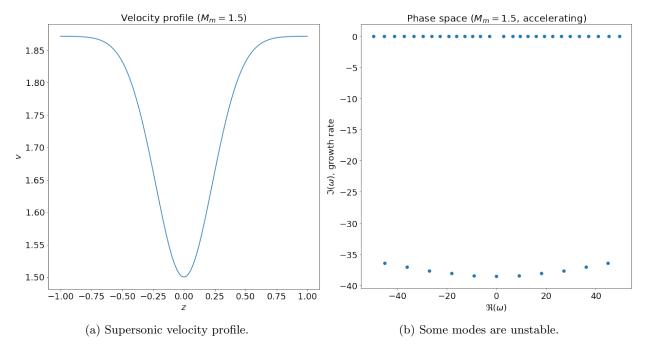

Figure 8: Solution to the polynomial eigenvalue problem Eq.(8) with supersonic velocity profile. ω 's are not on the real line, meaning that supersonic mode should be unstable for most cases.
